Product Specifications - Airport Directory

Airport Directory Software

Designed for use in airports, the REDYREF™ Touch Screen Airport Directory provides visitors with a complete directory and wayfinding system. Most systems include a directory of area hotels, car rentals, restaurants, shopping, as well as area maps. Any listing can be linked to a floor plan showing the visitors current location as well as guide them to their destination.

Also available with the software is real time flight information displays, including arrival/ departure status and gate information. Visitors can view the information interactively with a touch screen interface, or passively by placing a series of monitors together. Each facility is different, and we work with you to select just the right mix of features. Our goal is to help your visitors, quick and efficiently, while not overwhelming them with information.

Updating the Directory - *Easy as can be!*

- Data updating is done either directly through the database application, using the on-screen keyboard, or using WebUpdate™. WebUpdate™ allows authorized users to edit the database information from any computer with a browser and web-access.
- Integrate directly into existing airport database.
- Multiple Directories can be networked to share a single source of data, with each directory showing a "localized" view (e.g. "You are Here").

Standard Features:

- Choose as many of the following buttons:
 - Search Flight Information
 - Search Hotels and Accommodations
 - Search Car Rental
 - Search Restaurants and Shopping
- Any listing can be linked to a wayfinding map.
