### Product Specifications – University Directory

#### School/ University Directory Software

Designed for use on school and university campuses, the REDYREF™ Touch Screen University Directory provides visitors with a complete directory and wayfinding system. This electronic directory is quick and convenient. The system offers directories by department and/or individual, and any listing can be linked to an area map to guide visitors to their destinations.

Standard features also include a listing of campus events, campus amenities and real time links to campus news, sports scores and weather. Since every campus is different, we work with you to select the right combination of features to best suit your directory needs.

Updating the school/ university directory couldn't be easier or more efficient. Designated personnel in a remote location, or right at the directory kiosk, can update all data with the touch of a button.

#### Updating the Directory - *Easy as can be!*

- Data updating is done either directly through the database application, using the on-screen keyboard, or using WebUpdate™. WebUpdate™ allows authorized users to edit the database information from any computer with a browser and web-access.
- Multiple Directories can be networked to share a single source of data, with each directory showing a "localized" view (e.g. "You are Here").

#### Standard Features:

- Choose as many of the following buttons:
  - Search by Department
  - Search by Individual
  - Campus Events
  - Campus Amenities
- RedyRef inputs all initial data.
